

ABSTRACT

A rubber holder on the DR side (22a) having rod-shaped spring members fixed to holding blocks and a plurality of holding bridges (26) fixed to these rod-shaped members at specified intervals is provided on a wiper blade on the DR side, and a stopper (34) is attached to the rubber holder on the DR side (22a). The stopper (34) has a plurality of deformation restricting blocks (35) disposed between engaging portions (37) formed on the holding bridges (26) and linking strip portions (36) for linking the deformation restricting blocks (35). When excessive bending force is applied to the wiper blade on the DR side, the deformation restricting blocks (35) interfere with the engaging portions (37), or the linking strip portions (36) restrict the increase of the distance between the deformation restricting blocks (35), thereby restricting the deformation of the rubber holder on the DR side (22a) within the range of elastic deformation of the rod-shaped spring members.
